Hello Addepar team!

Helping people is one of my biggest passions and reasons that drive me to be who I am. Especially when it comes to finances. As someone who grew up not really learning about that world, and having had a hard time navigating through it, I sympathize with folks who are in that boat. So when I saw Addepar was hiring for a Software Engineer, I knew I had to apply. I believe my experience in Full Stack allows me to be a better, and more effective Front End Engineer and allows me to be a great contributor to Addepar.

Recently, I worked as the UI Lead to create a Web Application that would allow users to attend certain local events, while also offering ride-sharing services. Although the application was initially stated to be used on a desktop, we had to create a design and UI that would work well for both desktop and mobile. Discussing with a team of engineers, we considered several different options, but eventually decided to move forward with a mobile-first design. We focused on making a clean and minimalistic user interface so that the users would be able to access the application's functionalities whether they were viewing from a desktop or mobile device. Given the responsibility as UI Lead, I had to learn how to collectively utilize the team's input and create a design that not only focused on our customer's needs, but also was the result of a team effort.

I would love the opportunity to use my knowledge with full stack and my skills as a Front-End Engineer to contribute to Addepar and build helpful and elegant products. I truly appreciate you taking the time to read this cover letter. I would love to set up an interview to further discuss my skills and how I can best fit. Thank you in advance!

All the best,
Jinhoo Bong
